

# Training

## **Training sessions are prepared to suit your individual requirements.**

Effective training is always tailored to individual requirements. Otherwise, it wouldn't make much sense.

Clearly, the training sessions are geared to the operators' existing level of knowledge and, of course, to their specific needs.

From the basics of refrigeration technology to the individual coolers for the most diverse situations, including the key topics of commissioning, maintenance and, of course, fault analysis and rectification.

More specifically, our training courses cover the following areas:

- Principles of the refrigeration circuit
- Principles of the water/oil circulation system or ventilation technology
- Control and regulation technology
- Fault analysis
- Legal requirements (leak test)

The specific goals of the training

- Communicating the functionality of the best refrigeration units for you
- Identifying and localizing simple errors and rectifying them
- Learning to perform maintenance work

The general conditions of training:

- The training can take place at your premises or at our factory in Nassau
- The trainers we provide are experienced professionals with a wealth of specialist knowledge.

## **Have we got you interested?**

Then we will be happy to make you a training offer to suit your requirements.
